

What is allowed in AI scripts

When we're working with AI scripts we have the following functionality available to us:

- The XS language
- The XS syscalls
- The AI syscalls
- The KB syscalls

A syscall is a function that allows interacting directly with the engine. For example, asking the engine how many of a unit we have you would use `kbUnitCount`, this is a KB syscall. Doxygen has information on all possible syscalls, read about it here: "[BANG documentation\XS documentation\How-to Doxygen](#)".

XS language

Read the "[BANG documentation\XS documentation\XS language syntax](#)" document to learn more about how to write this scripting language.

Misc: try to stick to the XS standards outlined in "[BANG documentation\XS documentation\XS standards](#)".
