

Config basics

What is a config?

A config enables/disables custom behaviour for the game. Take for example the *noIntroCinematics* config. If it's defined then all the movies that play during startup of the game skipped, while for people who don't have it defined they're always played.

Configs can also be used to set a value for some behaviour. For example *aiChatDelay=60000* will override the default value used for determining how often an AI can send a chat message to 1 minute (60000 is in milliseconds).

Another word for config is *launch parameters*.

Where to define configs?

There are multiple files that control what configs are active but for this guide we're only interested in setting configs for ourself. The file that does that is called *user.cfg*. The configs that are active for everybody equally are saved in *game.cfg*.

Navigate to:

✓ `..\Users\<your username>\Games\Age of Mythology Retold\<your steam ID>\config`

Create a new text file named *user.cfg* in this *config* folder. Make sure the file ending is indeed *.cfg* and **NOT** *.txt*! You may want to look at the details of the file to see if the extension was properly set.

i You might find two folders inside the `|Age of Mythology Retold|` folder:

- 0 (if running the game without Steam).
- A long string of numbers (steam ID), such as 76561198043853148.

The *user.cfg* you define in either one does not apply to the other one, so setting up your configs inside the folder with the numbers and then launching the game without Steam will see all your configs gone.

How to enable configs?

You should now have a *user.cfg* created that we can edit. Below is a screenshot of an example *user.cfg* layout. This file is not case sensitive, but for readability it's handy to type it in camelCase.

```
user.cfg - Notepad
File Edit Format View Help
noIntroCinematics
generateAIConstants
aiDebug
enableTriggerEcho
DataValidation
```

Whatever configs are saved inside the *game.cfg* file are **overwritten** by whatever you put in the *user.cfg*.

This file also accepts comments with the `//` syntax.

When do configs apply?

The *user.cfg* is **only** read on startup. Thus if you want to swap configs around you must **restart** your game.
