

Hotkey basics

What is a hotkey?

A hotkey is a keyboard key/mouse button combination that triggers an action in the game, like pressing Q to build a House. All hotkeys that regulars players need can be set via in-game methods. This guide explores setting custom hotkeys for modding purposes.

Where to define hotkeys?

There are multiple files that control what hotkeys are active but for this guide we're only interested in setting hotkeys for ourself. The file that does that is called *user.con*. The hotkeys that are active for everybody equally are saved in *game.con*.

Navigate to:

```
✓ ..\Users\<your username>\Games\Age of Mythology Retold\<your steam ID>\config
```

Create a new text file named *user.con* in this *config* folder. Make sure the file ending is indeed .con and **NOT** .txt! You may want to look at the details of the file to see if the extension was properly set.

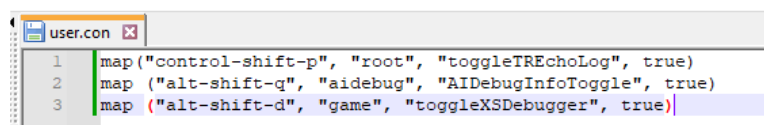

i You might find two folders inside the |Age of Mythology Retold| folder:

- 0 (if running the game without Steam).
- A long string of numbers (steam ID), such as 76561198043853148.

The *user.con* you define in either one does not apply to the other one, so setting up your hotkeys inside the folder with the numbers and then launching the game without Steam will see all your hotkeys gone.

How to enable hotkeys?

You should now have a *user.con* created that we can edit. Below is a screenshot of an example *user.con* layout. This file is not case sensitive, but for readability it's handy to type it in camelCase for some parts.

```
1 map("control-shift-p", "root", "toggleTREchoLog", true)
2 map ("alt-shift-q", "aidebug", "AIDebugInfoToggle", true)
3 map ("alt-shift-d", "game", "toggleXSDebugger", true)
```

The hotkey on line 1 is not bound by default, so you actually need *user.con* to access this feature.

Whatever hotkeys is saved inside your in-game hotkey editor or the *game.con* file are **overwritten** by whatever you put in the *user.con*.

This file also accepts comments with the // syntax.

When do hotkeys apply?

The *user.con* is **only** read on startup. Thus if you want to swap hotkeys around you must **restart** your game.
