Change History

Version	Changes

1 Introduction

The purpose of this document is to provide additional details about PopcornFX in case mod developers are able to make use of custom effects. While not directly supported at the moment it may be possible to bake and import PopcornFX assets into the game. Due to the baking process it is likely the files included with the game are not possible to modify, however, it may be possible to author new assets for those with access to Popcorn.

2 Popcorn Version

Age of Mythology: Retold is currently using version: **2.19.6.21657**

You will need to match this version exactly when generating and baking assets. If the version is not matched correctly it is likely the files will be incompatible with the game.

3 Baking Command

After creating a new asset in PopcornFX the following command is recommended for baking:

```
PK-AssetBaker.exe -f -x=1hyup ...
```

This is the way assets are baked for use in the live game before packing.

4 PopcornMetaData.xml

You may need to add your new popcorn asset as an entry to the PopcornMetaData.xml file. This defines whether the effects only update when visible or if they always simulate. Typically they

should only “always simulate” when necessary to make the effect look correct when it comes into view.
