

How-to Doxygen

Doxygen is a tool to generate files that can display information in a web browser. All potential syscalls that can be used in XS scripts are documented in such fashion. To find this documentation you must open the doxygen_retail.7z that comes with installing the game. This file can be found in the root folder of where you installed the game. This folder can easily be found via Steam by right-clicking Retold in your library -> Manage -> Browse local files. To open a .7z file you need either WinRAR or 7zip installed. After opening the .7z you can click on any of the .html files to open the page. You can then navigate it via the top bar like so:
