

VS Code adjust settings

Comply with XS coding standards

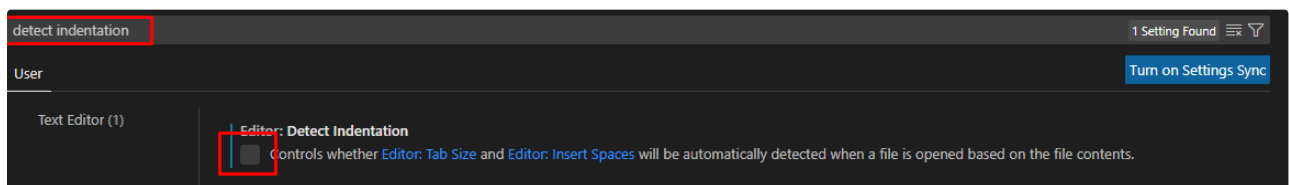

1. Open settings like so:

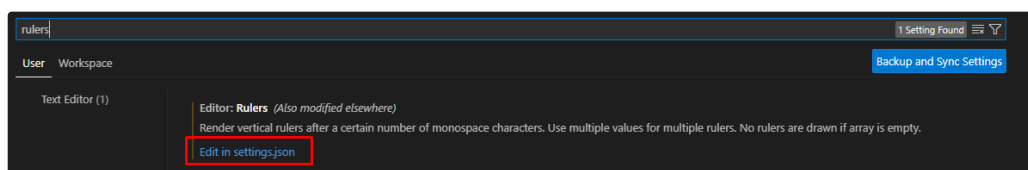

2. In the window that just opened we can instantly change Tab Size to 3 and tick the "Insert Spaces" radial button.

3. In the “Search settings” bar type “detect indentation” and turn it off.

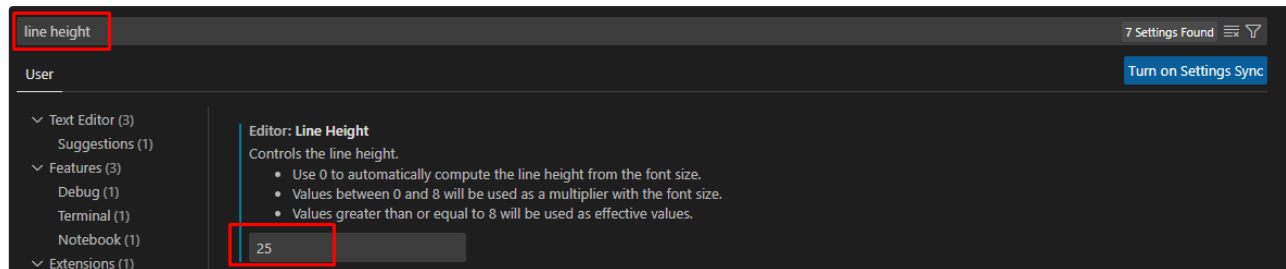

4. We need to make sure we’re not writing lines that are too broad according to the XS standards. VS Code can help you visualize this width. In the “Search settings” bar type “rulers”. Click on “Edit in settings.json” and then type 130, so it looks like this:

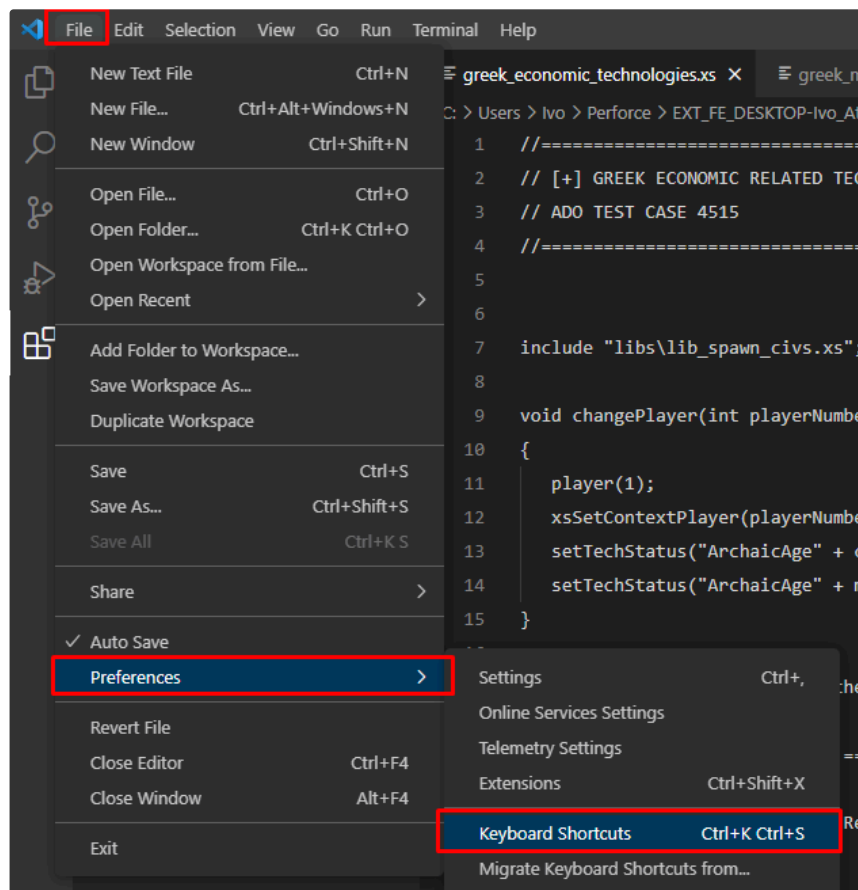

```
"editor.rulers": [  
  130  
]
```

Optional changes

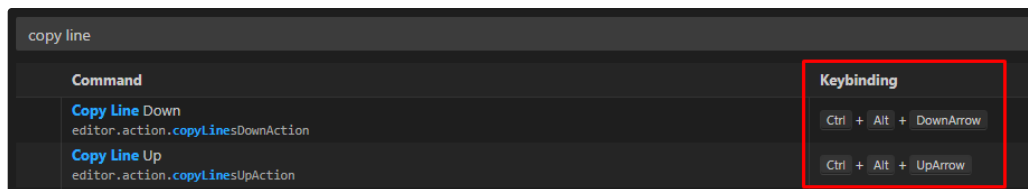

1. Open the settings like shown in step 1 from the first section. In the "Search settings" bar type "line height" and change the number from presumably 40 to 25.

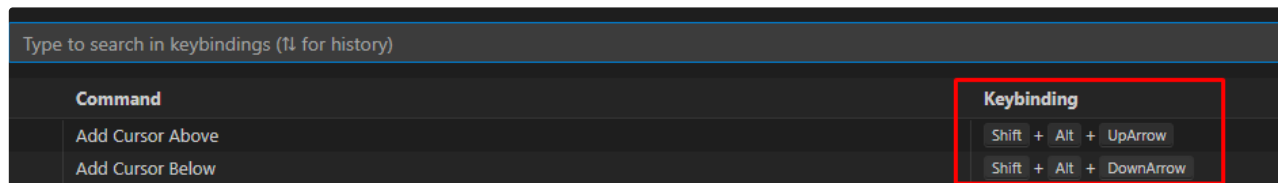

2. Open the hotkey editor:

3. Change multi line selection hotkeys. First we unbind the following 2 hotkeys:

4. Now bind these two to these combinations:

Tip: Changing your default program for opening .xs files to VS Code. This can be easily done inside windows. Open start menu and type “default apps”, at the bottom click on “Choose default apps by file type” and there scroll down to .xs and change the default app.
