

What is XS

XS is the name for the proprietary scripting language that is used by the BANG engine. It has been around since the original release of Age Of Mythology. All scripts for Age Of Mythology Retold are written in this language, there is no secondary language. XS is most similar to the C programming languages, although it's of course **a lot** more basic than them.

All the XS scripts the game uses are available to all users. They are not packaged into .bar files and are unencrypted. Meaning that you can read how the default AI works just by browsing your local files.

The scenario editor's *Triggers* interface is a visual representation of the XS language. Under the hood everything you do compiles into an XS script if you actually play the scenario.
